<Deadline: 16/11/2007>

<Programme: >

<Project Title: Quality change of human capital in the context of transnational>

<Financial Scheme: >

<Description: The basic questions to be solved in the frames of the project:

The focus of interest of the research is the situation of transnational interaction, the kind of stable interaction that is formed beyond socio-cultural frame of a country. The aim of the research is to evaluate the influence of transnational interaction on the structure and quality of human capital. Under the human capital we mean the integrated indicator that includes the level of one's education, cultural competence, tightness of integration to social networks and the idea of social and individual sociocultural space character and nature.

Methods and approaches suggested:

The research supposes involvement of following theoretical approaches:

1. theory of globalization developed by Y. Beck, the one of the few theorists, who gives the definition of the phenomenon of transnational interaction.
2. the conception time and space by Hagerstrand and Giddens (in his structuration theory) that allows to understand basic principles of action in situation of transnational interaction.
3. theories of human capital by J. R. Wolsh, B. Cheswick, F. Noimann and J. Mintzer. Integration of the approaches of the authors allows us to work out our point of view on the human capital conception as complex phenomenon of one's knowledge and skills .
4. the conception of P. Bourdieu, namely the conception of field as the space of relationships between the objective personal and institutional positions.
5. the conception of knowledge at hand by A. Schutz, in particular the ways of knowledge at hand compensation in the process of establishing stable forms of interaction.

Methods of the research

For the realization of the project were taken several methods. First, quantitative formalized methods that allows to compare main tendencies of interaction in cross-cultural aspects. On the next step the quantitative logic of analysis will be chosen, namely the biographical interview method.

The expected final scientific results of the project:

1. Developing the model of human capital (its development in transnational interaction conditions);
2. Constructing models of mutual influence of human capital and transnational interaction;
3. Finding out the mechanisms of the influence and possible causes of change in structure and quality of human capital under the influence of transnational interaction.

The most important results of ICSI MUH in the project development: During 2005 - 2007 in ICSI MUH several analytical and experimental investigations were realized.

Their aim was to examine changes in social and relationships in postindustrial society, influence caused on them by socio - economical factors, and informational-communicational technologies (ICT).

Currently (in spring - autumn 2007) project on studying of influence caused by transnational interaction on the quality of human capital was started in cooperation with COBE University (Japan) >

<Organisation Type: Centro di Ricerca>

<Partner Sought: Required skills / expertise of partners:

1. Research centers interested in problems of transnational

interaction on the theoretical and empirical level of analysis. Especially those, who have an experience in developing the theory of transnational interaction themselves.

2. Organizations that are interested in assisting ICSI MUH on the data gathering (fieldwork) and further discussing the of the project.
